Movement of cells through cell culture dishes: a comparative study of two cell culture systems. The experimental culture of cells in cell culture systems is characterized by a range of problems and difficulties. One of the major difficulties is the ability of cells to move through the medium and this problem has been studied in two cell culture systems. One is an open-pore tube type system, where the cells are moved through the cell culture medium in a stack, and the other is a membrane system, where the cells are moved through the cell culture medium between two permeable membranes. The experiment has been carried out in a cell culture dish of 6 cm diameter with open pores (50-microns in diameter). The movement of the cells was evaluated by cell counts in the medium at different times. In both systems the cells left the medium very soon after addition, but the rate of loss of cells varied. In the open-pore tube system cells lost more than half of their number within the first 30 min, whereas in the membrane system more than 95% of the cells remained in the medium for 24 h. The only way to get a job at the Sun is to be a C programmer, because the Sun's tech support department is so bad, it is more trouble than it is worth for the guys to do anything more than make sure the Sun doesn't crash in the middle of a running job. In addition, the job description says that you are going to have to be a Sun programmer. I don't think Sun actually cares which language you know. Sun's tech support department is the reason why Sun is no longer as successful as they once were. It is like they have a kind of software quality control department that does nothing except to ensure that the Sun runs on time and doesn't break. Any time I get a call from the Sun's tech support department, I hang up on them. The guys have a field day when they find out I work for the Sun because I do all of my programming on their platform. It is like a great way to get a laugh from the guys. At my last job, the tech support guys kept trying to get my boss to upgrade me to the Sun, but I refused and ended up staying with that company for six years. Now, I am working on my own and have no use for Sun. I will never go back to them, unless they start offering Java jobs. 03-15-2003, 08:40 PM Eli Goldston 82157476af
